the side surface (14a) and the driven surfaces of both pulleys. Meanwhile, document 2 discloses a feature wherein the metal wire material is bent into the shape of an element and then pressed in order to form the element. Therein, document 1 and document 2 both pertain to push blocks, and thus it would have been easy for a person skilled in the art to conceive of combining the inventions that are disclosed in documents 1 and 2.

The invention set forth in claim 13 does not involve an inventive step in the light of document 2 and document 3 cited in the international search report. Document 3 discloses a feature wherein the contact surface (50a), which is located at the center in the widthwise direction, decreases the thickness of the oil film and thereby increases the coefficient of friction. Therein, documents 2 and 3 both pertain to push blocks, and thus it would have been easy for a person skilled in the art to conceive of combining the inventions that are disclosed in documents 2 and 3.

The invention set forth in claims 15 to 17 does not involve an inventive step in the light of document 2 and newly cited document 4.
